

From first contact to printed Twin Card in under 60 seconds.

The Journey

Zero to 100 in less than 60 seconds.

The booth team observed a complete guest-facing journey: person approaches the booth, photo is captured, the digital twin card is generated, the final card is printed, and the attendee leaves with the card and goodie bag.

1. Approach

Staff greeted the attendee and captured the intent/photo moment.

2. Generate

Average system generation was 29 seconds, with median at 25 seconds.

3. Print

All generated cards were moved through to final print output.

4. Takeaway

Attendee left with a tangible Twin Card and event goodie bag.

Booth Funnel Outcomes

Generated		100%
Printed		100%
Email sent		82%
Survey completed		2%

Operationally, the avatar-to-print flow worked. The post-event conversion signal is still thin:

Generation Mix

49 fal.ai generated cards
5 Stability generated cards
2 fallback cards

The base system held up in production. Fallback was limited to 4 percent of live runs.

Board Observations

- Attendees engaged with the avatar experience and the booth team did not report complaint patterns from the printed-card journey.
- The process is promising, but still needs polish before it can be considered a smooth conversion engine.

one completed survey was recorded from 46 emails sent at the time of this summary.

- The largest gap is the transition after the avatar: attendees should not be left only at the card level.
- The end-state observation is clear: app account, avatar inside VeeVee, and a reason to return should all be part of the same completed journey.

Interpretation: The base journey worked in a live expo setting. The next board discussion is about conversion quality, not whether the booth concept can operate.

Scope: Twin Card metrics only. SWCA rewards data is intentionally excluded.
